

How to create a case study flashcard

1 • Decide which case study you're going to revise using the 'Everything you need to know case study booklet'. You may want to keep papers 1 and 2 on different coloured flashcards.

Can find yours?
A digital version is also on Teams.

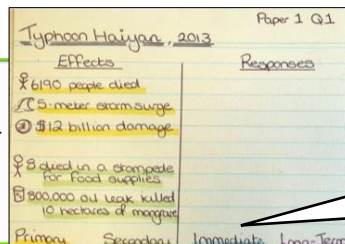

2 • Use the specification at the bottom of the page to pick out the key elements you need to revise. Use this to create the headings on your flashcard.

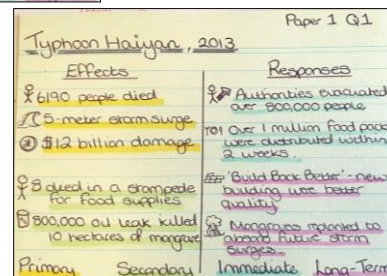

Specification Headings
Notice how my headings use exact specification phrases.

3 Pick out a few key facts for each heading – choose ones you're most likely to remember, not just the shortest. Try and include a variety e.g. social/economic/environmental etc.

Use a key if things fit into categories, use a key to make this clear

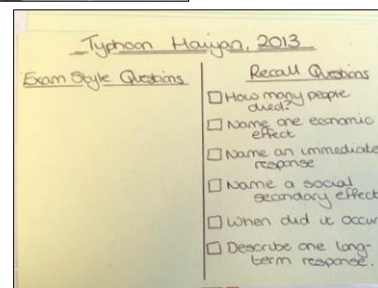

4 • Keep your notes to one side of the flashcard. Use dual-coding to add some small images to help you remember key points.
• Double check the booklet to ensure all key elements are included.

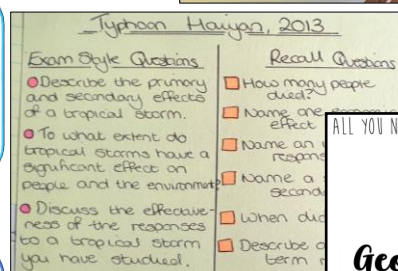

5 • Split the back of your flashcard into two sections. On one side, write 3-5 recall questions that test your knowledge of this case study. The answer must be on the other side of the flashcard.

6 • On the other half of the back, write some exam style questions that you could be asked on this content. To do this, look back at the specification and pick out exact phrases. Combine them with command words to make exam style questions.

7 Test yourself! Either working on your own, or with someone else, ask yourself the recall and exam style questions. You should try to answer them without looking at the answers.

8 • Complete more flashcards for other case studies. You should aim to look back at older flashcards regularly as you make new ones, mixing up new and old topics as you go. This is called spaced practice.
